Result: significantly lower germ count and significant germ reduction after disinfection on the daisygrip

daisygrip – the logical next step for hygienic blood sampling!

Benefits of daisygrip

Intuitive, self-finding magnetic lock allows for single-handed use.

Simple, hygienic wipe disinfection of smooth surfaces. Germs are swiftly removed.

Fast on-site disinfection in just 30 seconds allows for integration into everyday routines.

Skin-friendly material that slides comfortably along the patient's arm.

Modern and innovative design.

Fast and easy handling without major changes to the practiced and familiar routines.

Prevention of nosocomial infections saves significant costs while protecting and maintaining your institution's reputation.

daisygrip – the new standard for hygienic blood sampling

In today's world, nosocomial infections complicate and burden the daily medical routines in hospitals and private practices. At the same time it represents a considerable financial burden on the healthcare system. Hospital germs are a hot and very emotional topic since they are a cause of great anxiety for patients.

As a means of prevention, the risk of infection should already be reduced at the first blood sampling and cross-contamination through carryovers of germs should be prevented.

daisygrip has succeeded in revolutionizing the conventional venous tourniquet consisting of cotton fabric in many ways: through optimized application, modern design and an effective disinfection that can actually be implemented in everyday clinical practice, there is nothing in the way of hygienic blood collection and one wonders why it is not being handled that way yet!

Help to effectively prevent germ transmission and introduce the hygienic blood sampling with daisygrip!
